## Introduction

This document lists the study variables investigated in PEDSnet research. These variables represent analytic constructs derived from data harmonized across electronic health records (EHRs). The variables are organized in two separate tables. The first groups the variables according to “Clinical Domain”, or the area of clinical care each variable addresses. These categories were developed by PEDSnet, and include:

- Clinical Laboratory Results
- Conditions
- Diagnostic or Therapeutic Procedures
- Health Services
- Medications
- Physiological Measurement
- Social Determinants of Health

The second table groups variables in broad contextual categories using terms from the National Library of Medicine's Medical Subject Headings (MeSH) vocabulary. A single variable may appear multiple times among various categories. These groupings are intended to reflect the study context and rationale for variable development rather than define all potential uses. Categories include:

- |                                  |                                                        |
|----------------------------------|--------------------------------------------------------|
| • Cardiovascular Diseases        | • Nervous System Diseases                              |
| • Clinical Laboratory Techniques | • Nutritional and Metabolic Diseases                   |
| • Digestive System Diseases      | • Otorhinolaryngologic Diseases                        |
| • Endocrine System Diseases      | • Pathological Conditions, Signs and Symptoms          |
| • Environment and Public Health  | • Population Characteristics and Socioeconomic Factors |
| • Eye Diseases                   | • Psychiatry and Psychology                            |
| • General Practice               | • Respiratory Tract Diseases                           |
| • Health Status Indicators       | • Skin and Connective Tissue Diseases                  |
| • Hemic and Lymphatic Diseases   | • Stomatognathic Diseases                              |
| • Immune System Diseases         | • Urogenital Diseases                                  |
| • Infections                     |                                                        |
| • Musculoskeletal Diseases       |                                                        |
| • Neoplasms                      |                                                        |

Each entry in the list links to the variable's corresponding online record in [PEDSpace](#), PEDSnet's open-access digital asset repository. In PEDSpace, users can download code sets and access additional details, including the logic used and the studies that employed the variable.
